

Problem & Validation

Increase Voice adoption and repeat usage among Indian mobile ChatGPT users by helping them discover when Voice is more useful than typing.

Problem Definition

Question	Answer
What is the problem?	Low ChatGPT mobile voice adoption in India
Who is facing the problem?	Indian mobile-first, multilingual ChatGPT users who often default to typing and may face barriers related to language, accent, dialect, or conversational context when using Voice.
What is the business value that will be unlocked by solving the problem?	Higher voice adoption and repeat usage can drive stronger engagement and retention among Indian ChatGPT users
How will the target users benefit if the problem is solved?	Users can have more natural conversations with ChatGPT when speaking is more convenient or useful than typing.
Why is it urgent to solve this problem now?	Helping users discover when Voice is more useful than typing can increase Voice adoption and repeat usage in a large, mobile-first, multilingual user base in India.
See problem/causal diagram	

Goals

What change do we want to create for the user or business?

Priority	Goal	What it aims to achieve?
P0	Increase Voice adoption	More eligible users use Voice
P0	Improve Voice discoverability	More users recognize and start Voice through relevant contextual entry points
P1	Increase repeat usage	More Voice users return and use Voice again

Team: Product Management
Contributors: Radha D S and Teams
Status: In Development
Launching on: ChatGPT Mobile - India
Resources: Milestone1 Milestone 2 [annotated wireframes](#), Clickable [Simulation](#)

Success Metrics

How do we know if we achieved the product/user outcomes we wanted?

Metric Type	Metric	What it measures?	Formula
North Star	Voice adoption rate	How many eligible users use Voice	Voice users ÷ Eligible users × 100
Leading	Voice start rate	How often users start Voice after seeing a contextual entry point	Voice starts ÷ Voice entry-point views × 100
Lagging	Repeat Voice rate	How many Voice users come back to use it again	Users with ≥2 Voice sessions ÷ Voice users × 100

Guardrail Metrics

Did we achieve outcomes without causing problems elsewhere?

Guardrail Metric	What it measures?	Formula
Voice abandonment rate	How often users leave Voice without completing the interaction	# abandoned Voice sessions ÷ # Voice sessions started
Negative feedback rate	How often users report a poor Voice experience	# negative feedback responses ÷ # users who provide feedback

Problem & Validation

Non-functional Metrics

Is the system performing reliably and efficiently?

P	Non-functional metric	What it measures	Formula / unit
PO	Entry-point render rate	Whether the right contextual Voice card appears when eligible	Rendered cards ÷ Eligible card opportunities
PO	Voice launch success rate	Whether tapping a contextual card successfully starts Voice exploration	Successful Voice launches ÷ Card taps
PO	Multilingual comprehension rate	How reliably Voice understands mixed-language and language-switching turns	Correctly understood multilingual turns ÷ Total multilingual turns
P1	Exploration turn completion rate	Whether users can complete a Voice turn without technical failure or interruption	Completed turns ÷ Voice turns started
P1	Exploration response latency	Whether Voice responds quickly enough to maintain back-and-forth flow	Seconds — P50 / P95

Non-Goals

In this project, we do not cover the following:

Non-goal	Scope boundary
Replace typing with Voice	Voice remains an option, not a replacement.
Redesign ChatGPT Voice	Focus on contextual entry points and exploratory Voice interactions
Change underlying Voice/model capabilities	Leverage existing speech and model capabilities
Cover all Voice use cases	Focus on selected contexts where multilingual exploratory Voice adds value.

Validation of the Problem

Insights from competitive landscape

Existing products give users familiar reasons to use voice:

Products	Clear role of voice
WhatsApp	Voice for fast communication.
Alexa	Voice as a primary way to interact
YouTube/Search	Voice for search and discovery.
Key Insight for ChatGPT: Users know Voice exists, but they don't always know when or why to use it instead of typing.	

Insights from User Research and Survey

Research identified several barriers to Voice adoption. 50% prefer typing, and 50% have tried Voice only once. This suggests we need to help users see when Voice is useful enough to use again.

What is the main reason you don't use ChatGPT Voice more often?

Have you ever tried ChatGPT Voice?

How Might We Question?

How might we help Indian multilingual mobile ChatGPT users discover and act on moments where Voice is more useful than typing?

Target User & Opportunity

Selected User Segment

Indian multilingual mobile ChatGPT users who may use English, Hindi, Hinglish, or other languages in everyday interactions.

Mobile-first, multilingual context: 85.5% of Indian households had at least one smartphone in 2025, while 97.1% of 15–29-year-olds reported using a mobile phone. India’s voice landscape spans 15 languages and 139 regional clusters.

Sources: Government of India, Ministry of Statistics & Programme Implementation, Comprehensive Modular Survey: Telecom, 2025; Bhogale et al., “Voice of India,” 2026.

Prototype scenarios: Women, teenagers, professionals, and homemakers are used to test different scenarios in the prototype, not as separate user groups.

User Jobs & Needs

The JTBDs point to a common need: When I'm exploring an idea, I want to express incomplete or multilingual thoughts naturally and work through them in a rapid back-and-forth conversation, without having to know exactly what to ask or formulate the perfect text prompt.

For details, see the [JTBD diagram](#).

Solution

We identified four opportunities for Voice and prioritized them based on Impact, Voice advantage, Multilingual fit, and Habit potential.

Solution area	Impact	Voice advantage	Multilingual fit	Habit potential
<i>Explore an idea/topic through rapid back-and-forth</i> – Selected opportunity.	High	High	High	High
Manage an unexpected problem while I'm busy	High	High	Medium	Medium
Communicate naturally in my language	High	Medium	High	High
Talk through a personal situation	Medium	High	Medium	Medium

Voice Discovery → Habit

Solution & Experience

In the proposed solution, user users discover a situation → Start Voice → Speak naturally → Explore through conversation → Get value → Give feedback → Use Voice again. [See voice discovery and habit flow](#)

- ① **Voice Use Case**
Presents a few recognizable situations where talking can be more useful than typing, helping users understand when to try Voice.
- ② **Speak naturally:** Users can speak in the language they're comfortable with, without needing to select a language first.
- ③ **Keep typing as an option:** Users can choose Voice when it fits, without being forced to use it.

See more [wireflows](#)

- ① **Voice use case**
Limited time + an unclear starting point — User has a presentation in 30 minutes and wants to quickly think through the topic rather than formulate a detailed prompt.
- ② Voice lets users explain what they know and progressively clarify the problem through back-and-forth and discover.
- ③ Voice value - Speaking lets users think out loud and work through an idea, not just use ChatGPT hands-free.
- ④ Post-conversation feedback across screens captures perceived value and intent to use Voice again after the experience.

Key Features

What changes for the user?

Feature	Description
Situation-led Voice discovery	Show users situations where Voice may be more useful than typing.
Conversational exploration	Let users start with an unfinished thought and work through it with ChatGPT through real-time voice conversation .
Natural multilingual interaction	Let users speak in the language mix that feels natural instead of translating or carefully structuring the request first.
Post-conversation feedback	Capture perceived value and intent to use Voice again after the experience.

Key Logic

What needs to change behind the experience? For the prototype, keep the data model small.

Item	Details
Seed/template data	- Voice discovery contexts - Conversation titles - Starting conversation context - Feedback options
Interaction state	- Selected context - Current conversation - Voice active/inactive state - Conversation messages - Feedback response
Do not add user profiles, persona databases, language databases, analytics dashboards, or production Voice infrastructure unless a screen or interaction needs them.	
The final implementation handoff can translate this into a minimal JSON data model + matching Mermaid ER diagram.	

Prototype, Logic & Measurement

Launch Readiness

Are we ready to release this product or feature to real users?

Key Milestones	1. PRD finalized 2. User flow finalized 3. Annotated wireframes completed 4. Prototype data model defined 5. Responsive clickable prototype built 6. Prototype QA across mobile and desktop 7. User testing / feedback completed 8. Metrics and experiment plan finalized
Launch checklist	· All five screens are connected. · All primary interactions are clickable. · Back-and-forth Voice conversation works as intended. · Feedback appears after each conversational experience. · Prototype works across mobile and desktop. · Prototype is shareable. · No unsupported product features are introduced.
<u>Experimentation plan</u>	Test whether situation-led Voice discovery improves the journey from: Discovery → Voice trial → Successful experience → Repeat Voice usage
	Compare the new contextual entry point with the current Voice experience to see whether users are more likely to discover, try, and return to Voice.

Key trade-off

We are focusing on one opportunity rather than trying to solve every Voice adoption barrier: *Help users discover situations where conversational exploration is more useful than typing.*

Open Questions & Decisions Taken

Question / Decision	Status
What is the core adoption problem?	Decided: Users don't consistently understand when or why Voice is better than typing.
Which opportunity should we prioritize?	Decided: Explore an idea or topic through rapid back-and-forth.
Should Voice replace typing?	Decided: No. Voice should be the better option when it adds value.
Is multilingual a separate solution?	Decided: No. It is a lens across use cases.
What are the prototype use cases?	Decided: Presentation, interview, decision-making, plus a multilingual/multitasking scenario.
Should there be a separate habit-reinforcement screen?	Decided: No. Repeat use should come from useful experiences.
Where should feedback appear?	Decided: After each conversational experience.
What does feedback measure?	Decided: Perceived value and repeat intent, not actual retention.
Should login/access friction be part of the core prototype?	Descoped: Keep it as a separate product/business hypothesis.
Should we solve Voice recognition quality?	Descoped: Outside this solution's scope.
Should we build production Voice infrastructure?	Descoped: No production Voice infrastructure will be built. The prototype will demonstrate the Voice interaction without building production infrastructure.
